

As of 31/03/2023

Rolling returns (%)

Time Period: Since Common Inception (01/09/2015) to 31/03/2023

Rolling Window: 3 Years 1 Month shift

Investment mandate and objectives

The objective of this portfolio is to outperform the CPI + 5% target over a rolling 7 year period. The portfolio has exposure to both local and offshore assets. This portfolio has been designed for capital growth through direct market exposure but with some limited downside protection.

Features: Regulation 28 compliant
Multi-asset class exposure
Local and International exposure

Fund facts:

Multi manager: GTC
Benchmark: CPI + 5% over a 7 year rolling period
Risk profile: Moderate to High Risk

Longest history cumulative performance (%)

Time Period: 01/04/2016 to 31/03/2023

Calendar year returns (%)

Market summary

- Local equity markets ended the month negative, close on -2%, pulled down primarily by the local financials sector (-5.8%) as investors feared what impact the international banking sector sell-off would mean for local banks. The local property (-3.4%) and industrials (-0.8%) sectors were negative as well while the local resources sector added some +2.9% to market performances.
- The South African Reserve Bank (SARB) raised interest rates in March by 0.5% taking the repo rate to 7.75% in their response to South Africa's persistently high inflation rate of 7.0%.
- The local bond market (ALBI) delivered +1.3% for the month ahead of local cash (STEFI) at +0.6%.
- Despite the fear surrounding the international banking sector, both developed and emerging equity markets ended the month up +3% in US dollar terms. However, as the Rand strengthened to R17.8 towards month-end, the overall Rand based returns for both these global equity markets turned slightly negative.
- As market volatility and economic uncertainty continue to be persistently elevated over the month, GTC remains cautious in our portfolio positioning as we navigate through this market cycle.

Glossary

Standard deviation

- Is a measure that is used to quantify the amount of variation or dispersion of a set of data values around the mean value. This measure is commonly known as volatility and referenced as an explicit measure of risk.

Maximum drawdown

- Is the maximum loss from a peak to a trough of a portfolio before a new peak is attained. Maximum Drawdown is an indicator of downside risk over a specified time period.

Sharpe ratio

- Is a measure for calculating risk-adjusted return, and this ratio has become the industry standard for such calculations. The Sharpe ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. In other words, it measures how much excess return a portfolio has earned in relation to the level of risk it is exposure to. The higher the ratio the stronger the risk adjusted return.

Calmar ratio

- Is a measure for calculating risk-adjusted return. It is the average return earned per unit of capital loss risk taken in the form of maximum drawdown over a given period.
