Quarterly commentary

- International equity markets had a strong quarter with developed markets earning +7.7% and emerging markets +4.0% in US dollar terms. The US dollar strengthened by +4.7% relative to the ZAR which further provided a tailwind for offshore assets' return over the quarter.
- US headline inflation (CPI) came in at 5% for the year ended February 2023 while the European Central Bank (ECB) continue to battle CPI at 9.9%. In response to elevated inflation the US FED hiked interest rates by 0.5% to 5.00% over the 3 months while the ECB increased rates by a total of 1.00 % to 3.50%.
- Overall, investor sentiment improved slightly as the hunt for yield increased over the quarter. Some reprieve was found in the global bond markets which ended the quarter up +3.5% in US dollar terms. However, the quarter's rally was not enough to off-set the deep negative return experienced in the preceding 9 months as the 1-year return remains in the red (-9.6% in dollar terms).
- As market volatility and economic uncertainty continue to be persistently elevated over the month, GTC remains cautious in our portfolio positioning as we navigate through this market cycle.

Glossary

Standard deviation

- Is a measure that is used to quantify the amount of variation or dispersion of a set of data values around the mean value. This measure is commonly known as volatility and referenced as an explicit measure of risk.

Maximum drawdown

- Is the maximum loss from a peak to a trough of a portfolio before a new peak is attained. Maximum Drawdown is an indicator of downside risk over a specified time period.

Sharpe ratio

- Is a measure for calculating risk-adjusted return, and this ratio has become the industry standard for such calculations. The Sharpe ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. In other words, it measures how much excess return a portfolio has earned in relation to the level of risk it is exposure to. The higher the ratio the stronger the risk adjusted return.

Calmar ratio

- Is a measure for calculating risk-adjusted return. It is the average return earned per unit of capital loss risk taken in the form of maximum drawdown over a given period.
