Market summary

- The South Africa's (SA) market was particularly weak in May 2023 due to the risk off sentiment amid allegations of weapons sales from SA to Russia
 and concerns surrounding the deteriorating electricity landscape. China also faced challenges as its economic recovery fell short of expectations. With
 the slowdown in global trade activity, China's manufacturing PMI for April 2023 dipped to 49.5 points, below the 50 point mark which separates an
 expanding manufacturing sector from a contracting one. Further volatility came from concerns surrounding the US debt ceiling as the government
 sought to raise the government's borrowing limit.
- Local equities declined over the month, impacted negatively by the aforementioned risk off sentiment towards South Africa. Financials were the worst performing sector, contracting -7.9%, which can largely be attributed to decline in major banks such as Capitec (-13.7%) and FirstRand (-6.4%). Despite South African specific headwinds, the Resources sector limited its pullback to -2.2% as the 8.4% rand weakness provided a tailwind to some of the rand hedged companies. The Industrials and Listed property sector fell at -3.3% and -5.3% respectively.
- Local cash delivered a positive return of 0.7% well ahead of the local bond index which ended the month -4.8%. The South African Reserve Bank's
 decision to increase rates by 50bps to 8.25% in May 2023 as well as the meaningful rise in yields due to outflows from foreigners explains much of
 the bond index's decline.
- In US Dollar terms, the MSCI Emerging Market equity index (-1.7%) lagged the MSCI World index (-1.0%) amid the increase in global uncertainty. The US Federal Reserve raised interest rates by 25bps to 5.25%, marking the highest level since August 2007. The Bank of England and the European Central Bank also followed suit with a 25bps rate hike.
- As market volatility and economic uncertainty continue to be persistently elevated over the month, GTC remains cautious in our portfolio positioning
 as we navigate through this market cycle.

Glossary

Standard deviation

• Is a measure that is used to quantify the amount of variation or dispersion of a set of data values around the mean value. This measure is commonly known as volatility and referenced as an explicit measure of risk.

Maximum drawdown

• Is the maximum loss from a peak to a trough of a portfolio before a new peak is attained. Maximum Drawdown is an indicator of downside risk over a specified time period.

Sharpe ratio

• Is a measure for calculating risk-adjusted return, and this ratio has become the industry standard for such calculations. The Sharpe ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. In other words, it measures how much excess return a portfolio has earned in relation to the level of risk it is exposure to. The higher the ratio the stronger the risk adjusted return.

Calmar ratio

• Is a measure for calculating risk-adjusted return. It is the average return earned per unit of capital loss risk taken in the form of maximum drawdown over a given period.
