Investment mandate and objectives

The objective of this portfolio is to outperform the CPI + 3% target over a rolling 5 year period. The objective is to also reduce volatility and provide some downside protection through the use of defensive strategies. The portfolio has exposure to both local and offshore assets. The portfolio is designed to generate growth over the long term, accepting that there will be some volatility over the shorter term.

Features:

- Regulation 28 compliant
- Multi-asset class exposure
- Local and international exposure

Fund facts:

Multi manager: GTC

Benchmark: CPI + 3% over 5 year rolling periods

Risk profile: Moderate Risk

Fund size: R 72 521 435

Market summary

- The Local equity market ended the month of April in the green, up +3.4% as Property (+5.4%), Resources (+4.2%), Financials (+3.3%), and Industrials (+3.1%) all rallied after a volatile March. While fears amid the impact of a slowdown in global trade and the international banking crisis remains, markets seemed to have settled somewhat during April.
- South Africa's inflation rate remains persistently high at 7.1% for the year ended April 2023. This represents an increase over the year ended March 2023 inflation print and increases the likelihood that the South African Reserve Bank will hike interest rates in May 2023 should inflation not abate meaningfully.
- The local bond market (ALBI) contracted -1.1% for the month behind local cash (STEFI) at +0.6%.
- Developed equity markets ended the month up +1.8% in US dollar terms propelled by better than expected US corporate earnings, while Emerging equity markets detracted some -1.1% in US dollar terms. The Rand weakened further some 3% to R18.4 towards month-end, providing a tailwind to the overall Rand based returns for both these global equity markets.
- As market volatility and economic uncertainty continue to be persistently elevated over the month, GTC remains cautious in our portfolio positioning as we navigate through this market cycle.

Glossary

Standard deviation

- Is a measure that is used to quantify the amount of variation or dispersion of a set of data values around the mean value. This measure is commonly known as volatility and referenced as an explicit measure of risk.

Maximum drawdown

- Is the maximum loss from a peak to a trough of a portfolio before a new peak is attained. Maximum Drawdown is an indicator of downside risk over a specified time period.

Sharpe ratio

- Is a measure for calculating risk-adjusted return, and this ratio has become the industry standard for such calculations. The Sharpe ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. In other words, it measures how much excess return a portfolio has earned in relation to the level of risk it is exposure to. The higher the ratio the stronger the risk adjusted return.

Calmar ratio

- Is a measure for calculating risk-adjusted return. It is the average return earned per unit of capital loss risk taken in the form of maximum drawdown over a given period.
