Worst	Local Property -25.3	Local Property 1.9	Local Property -34.5	Global Bonds 2.5	Global Emerging Markets -15.2	Local Property -4.4

Market summary

- Local equity markets ended the month up 3.8% primarily driven by the local financials sector (+11.4%) as investor sentiment improved over the month. The local property (+0.9%) and industrials (+3.7%) sectors earned positive returns while the local resources sector shed -8.2%.
- South African headline inflation (CPI) peaked in July 2022 at 7.8% and slowed to 6.3% in May 2023.
- The local bond market (ALBI) delivered +4.6% for the month ahead of local cash (STEFI) at +0.7%.
- Developed equity markets (+6.1%) outperformed emerging equity markets (+3.8%) over the month in US dollar terms. The ZAR strengthen from R19.7 to R18.8 towards month-end taking the overall ZAR based returns for both these global equity markets below that of the local equity market.
- As market volatility and economic uncertainty continue to be persistently elevated over the month, GTC remains cautious in our portfolio positioning as we navigate through this market cycle.

Glossary

Standard deviation

- Is a measure that is used to quantify the amount of variation or dispersion of a set of data values around the mean value. This measure is commonly known as volatility and referenced as an explicit measure of risk.

Max drawdown

- Is the maximum loss from a peak to a trough of a portfolio before a new peak is attained. Maximum Drawdown is an indicator of downside risk over a specified time period.

Sharpe ratio

- Is a measure for calculating risk-adjusted return, and this ratio has become the industry standard for such calculations. The Sharpe ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. In other words, it measures how much excess return a portfolio has earned in relation to the level of risk it is exposure to. The higher the ratio the stronger the risk adjusted return.

Calmar ratio

- Is a measure for calculating risk-adjusted return. It is the average return earned per unit of capital loss risk taken in the form of maximum drawdown over a given period.
