Market summary

- The BRICS summit held in South Africa confirmed the extension of its membership to Argentina, Egypt, Ethiopia, United Arab Emirates, Saudi Arabia and Iran.
- Local equities ended the month in the red, down -4.8% as all major sectors produced negative returns. Resources experienced the most significant decline (-9.6%), primarily due to the weak performance from Gold and PGM (Platinum Group Metals) counters. Industrials declined -4.7% while Financials detracted -1.8%. Local property earned a positive +0.9% return, ahead of the local equity market.
- Local cash gained a return of 0.7% and is up by 5.1% year to date while the local bond were slightly negative (-0.2%) amid the risk off sentiment over the month.
- On the back of elevated inflation, the Bank of England implemented its 14th consecutive interest rate hike, increasing the policy rate by 0.25% to reach 5.25% in August 2023.
- Emerging Market equities fell -6.1% USD and Developed Market equities detracted -2.4% USD over the month driven by ongoing weakness in China's economy and concerns that strength in the US economy will keep interest rates higher for longer.
- Adding to global market concerns, the credit rating agency Fitch, downgraded the US Government's credit rating from AAA to AA+, citing unsustainable debt and increased political dysfunction.

Glossary

Standard deviation

- Is a measure that is used to quantify the amount of variation or dispersion of a set of data values around the mean value. This measure is commonly known as volatility and referenced as an explicit measure of risk.

Max drawdown

- Is the maximum loss from a peak to a trough of a portfolio before a new peak is attained. Maximum Drawdown is an indicator of downside risk over a specified time period.

Sharpe ratio

- Is a measure for calculating risk-adjusted return, and this ratio has become the industry standard for such calculations. The Sharpe ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. In other words, it measures how much excess return a portfolio has earned in relation to the level of risk it is exposure to. The higher the ratio the stronger the risk adjusted return.

Calmar ratio

- Is a measure for calculating risk-adjusted return. It is the average return earned per unit of capital loss risk taken in the form of maximum drawdown over a given period.
