

GTC Passive Market Plus

As of 30/09/2023

Rolling returns (%)

Time Period: 01/10/2016 to 30/09/2023

Rolling Window: 3 Years 1 Month shift

Investment mandate and objectives

The portfolio employs a rule based (passive) investment strategy. The objective of this portfolio is to outperform a full risk composite benchmark over a rolling 10-year period. This portfolio has been designed for maximum capital growth through a combination of local and offshore asset exposure. The portfolio's offshore exposure provides diversification, higher return potential and protects against local currency depreciation.

Features:

- Regulation 28 compliant
- Full equity exposure
- Local and international exposure
- Capital growth

As of 30/09/2023

Market summary

- Local equity markets ended the month down 3.0%, pulled down by a near -4.0% sell-off across the local Industrials, Financials and Property sectors. The local Resources sector was the only positive sector, up 1.0%.
- South African headline inflation (CPI) peaked in July 2022 at 7.8% and slowed to 4.8% in August 2023.
- The local bond market (ALBI) delivered -2.3% for the month lagging local cash (STEFI) at +0.7%.
- Developed market equities (-4.3%) underperformed emerging market equities (-2.6%) over the month in US dollar terms. The dollar weakened -0.4% relative to the rand, further detracting from offshore assets' rand-based return.
- As market volatility and economic uncertainty continue to be persistently elevated over the month, GTC remains cautious in our portfolio positioning as we navigate through this market cycle.

Glossary

Standard deviation

- Is a measure that is used to quantify the amount of variation or dispersion of a set of data values around the mean value. This measure is commonly known as volatility and referenced as an explicit measure of risk.

Maximum drawdown

- Is the maximum loss from a peak to a trough of a portfolio before a new peak is attained. Maximum Drawdown is an indicator of downside risk over a specified time period.

Sharpe ratio

- Is a measure for calculating risk-adjusted return, and this ratio has become the industry standard for such calculations. The Sharpe ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. In other words, it measures how much excess return a portfolio has earned in relation to the level of risk it is exposure to. The higher the ratio the stronger the risk adjusted return.

Calmar ratio

- Is a measure for calculating risk-adjusted return. It is the average return earned per unit of capital loss risk taken in the form of maximum drawdown over a given period.
