Market summary

- Local equity markets ended the month up +4.2% on the back of positive investor sentiment stemming from the South African election results. SA focused stocks benefitted meaningfully over the month with Listed property up +6.0% and the broader Financials sector up +14.5%. The Resources sector declined -3.7%, on the back of a stronger Rand and weaker global commodity prices.
- The local bond market (ALBI) earned +5.2% for the month ahead of local equities and local cash (STEFI) (+0.6%). Improved investor sentiment spurred a rally in bond purchases from both local and foreign investors.
- The Emerging Market equity index (+3.9% USD) outperformed the Developed Market equity index (+2.1% USD) over the month, following the conclusion of India's election and an overall positive turn in emerging market sentiment. The Rand strengthened 3.0% against the US dollar over the month.
- Aligned with market forecasts, the European Central Bank cut interest rates by 25 basis points to +4.25% in June as inflation (+4.5%) continues to cool in the region. The US Federal Reserve kept interest rates unchanged between +5.25% to +5.50%, while the Bank of England also maintained its rate at +5.25% during its June meeting.
- As market volatility and economic uncertainty remain elevated, GTC remains cautious in our portfolio positioning as we navigate through this market cycle.

Glossary

Standard deviation

- Is a measure that is used to quantify the amount of variation or dispersion of a set of data values around the mean value. This measure is commonly known as volatility and referenced as an explicit measure of risk.

Maximum drawdown

- Is the maximum loss from a peak to a trough of a portfolio before a new peak is attained. Maximum Drawdown is an indicator of downside risk over a specified time period.

Sharpe ratio

- Is a measure for calculating risk-adjusted return, and this ratio has become the industry standard for such calculations. The Sharpe ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. In other words, it measures how much excess return a portfolio has earned in relation to the level of risk it is exposure to. The higher the ratio the stronger the risk adjusted return.

Calmar ratio

- Is a measure for calculating risk-adjusted return. It is the average return earned per unit of capital loss risk taken in the form of maximum drawdown over a given period.
