Market summary

- South African asset classes sold off early in September before rebounding to end the month in the green. Key factors driving performance over the month were South African Reserve Bank's (SARB) 25bps interest rate cut to +8%, improved domestic investor sentiment, and monetary stimulus out of China.
- Local equity markets ended the month up +4.0%, driven by performances from Resources (+3.7%) and Industrials (+5.2%) sectors. The local property sector continued its upward trend with a return +5.0% for the month.
- The local bonds delivered +3.9% for the month, outperforming the local cash which earned +0.7%.
- The MSCI Emerging Markets Index recorded +6.7% USD for the month lead by a significant rally in Chinese equities, up +23% USD. The MSCI World Index returned +1.8% for the month.
- In September, the US Federal Reserve exceeded market expectations by cutting interest rates by +0.5% to +5%, while the European Central Bank lowered its key deposit rate by +0.25% and the Bank of England held its key rate steady at +5%.
- As market volatility and economic uncertainty remain elevated, GTC remains cautiously optimistic in our portfolio positioning as we navigate through this market cycle.

Glossary

Standard deviation

- Is a measure that is used to quantify the amount of variation or dispersion of a set of data values around the mean value. This measure is commonly known as volatility and referenced as an explicit measure of risk.

Maximum drawdown

- Is the maximum loss from a peak to a trough of a portfolio before a new peak is attained. Maximum Drawdown is an indicator of downside risk over a specified time period.

Sharpe ratio

- Is a measure for calculating risk-adjusted return, and this ratio has become the industry standard for such calculations. The Sharpe ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. In other words, it measures how much excess return a portfolio has earned in relation to the level of risk it is exposure to. The higher the ratio the stronger the risk adjusted return.

Calmar ratio

- Is a measure for calculating risk-adjusted return. It is the average return earned per unit of capital loss risk taken in the form of maximum drawdown over a given period.
