## **Quarterly commentary**

- The South African Reserve Bank (SARB) continued its rate-cutting cycle during the quarter, reducing the repo rate by 25 basis points to 7.75%, a move that was largely in line with market expectations. The South African Chamber of Commerce and Industry (SACCI) Business Confidence Index (BCI) rose to 118.1 in November 2024, its highest level since October 2015, up from 114.2 in October.
- The MSCI Emerging Market equity index shed -8.0% over the quarter and +7.5% over the year, underperforming its developed market counterpart.
   China's performance was negatively affected by the absence of further policy stimulus and investor concerns around the impact of proposed Trump trade tariffs. Brazilian shares were the weakest among emerging markets, as the local currency depreciated due to growing concerns over the country's fiscal outlook. South Korea also posted losses amid political instability, with both the president and the acting president being impeached over December.
- The MSCI World Index was mostly flat at -0.2% for the quarter, however earned +18.7% over the full year. The index's positive performance is almost entirely driven by the US equity market which gained +25.0%.
- The U.S. Federal Reserve cut interest rate by a further 25 basis points in both November and December taking US interest rates to a range of 4.25% 4.5%. Federal Reserve Chair Jerome Powell emphasized that further rate cuts would depend on progress in reducing persistently high inflation. The European Central Bank (ECB) also cut interest rates by 25 basis points in both October and December taking its interest rate to 3.15%. ECB President Christine Lagarde signalled that more rate cuts could be expected in 2025.
- Overall, global investor sentiment was mixed over the quarter. While the short-term outlook is still unclear, the longer-term picture remains positive.
   Nonetheless, GTC remains cautious in our portfolio positioning as we navigate through this market cycle.

### Glossary

#### Standard deviation

Is a measure that is used to quantify the amount of variation or dispersion of a set of data values around the mean value. This measure is commonly known as volatility and referenced as an explicit measure of risk.

### Maximum drawdown

Is the maximum loss from a peak to a trough of a portfolio before a new peak is attained. Maximum Drawdown is an indicator of downside risk over a specified time period.

#### Sharpe ratio

Is a measure for calculating risk-adjusted return, and this ratio has become the industry standard for such calculations. The Sharpe ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. In other words, it measures how much excess return a portfolio has earned in relation to the level of risk it is exposure to. The higher the ratio the stronger the risk adjusted return.

#### Calmar ratio

Is a measure for calculating risk-adjusted return. It is the average return earned per unit of capital loss risk taken in the form of maximum drawdown over a given period.
