Investment mandate and objectives

The portfolio employs a rule based (passive) investment strategy. The GTC Passive Five fund comprises of both local and international asset classes, with a maximum exposure of 75% to equities. The fund is Regulation 28 compliant and aims to outperform inflation plus 5% over rolling 7 year periods. International exposure is kept within regulatory limitation which offers diversification and a local currency hedge.

Features: Regulation 28 compliant

Market summary

- Local equities ended the month slightly in the red (-0.4%) despite a rally from the index heavyweight, Naspers of +12.3%. The Resources sector was the main detractor, shedding -6.2% and erasing much of January's rally. This weakness was seen in counters such as Sibanye Stillwater (-21.8%) and Thungela (+19.2%). The Industrial sectors added 2.8% over the month as AB InBev rose +20.9%, while the Financials sector returned +0.8% with Discovery gaining +14.3%. The Listed Property sector shed -0.3%.
- The local bonds had a modest return of +0.1% as yields rose for the third consecutive month in February with accrued interest income offsetting capital decline in bond prices. Local cash (+0.6%) outperformed local bonds over the month.
- On 30 January 2025, the South African Reserve Bank (SARB) reduced its repo rate by 25 basis points, marking the third consecutive cut by the
 Monetary Policy Committee (MPC) and bringing the repurchase rate to 7.5%. The SARB Governor, Lesetja Kganyago, emphasised caution regarding
 further rate cuts for the remainder of the year, due to uncertainty in the global economic environment.
- The MSCI Emerging Markets Index returned +0.5% USD for the month outperforming its developed market counterpart. Chinese equities led the gain, with continued optimism surrounding its AI capabilities after the initial launch of DeepSeek's low cost open-source AI model in January.
- The MSCI World Index declined -0.7% USD for the month. The uncertainty surrounding the impact of trade tariffs on the US economy led to weak performance in the US equity market. In the UK, the Bank of England (BoE) reduced its benchmark interest rate by 0.25% to 4.5%, marking the third cut since the easing cycle began in August 2024. The BoE highlighted that monetary easing would progress slowly throughout the year, addressing concerns over slowing economic growth against persistent inflation in the services sector.
- As market volatility and economic uncertainty remain elevated, GTC remains cautious in our portfolio positioning as we navigate through this market cycle.

Glossary

Standard deviation

• Is a measure that is used to quantify the amount of variation or dispersion of a set of data values around the mean value. This measure is commonly known as volatility and referenced as an explicit measure of risk.

Maximum drawdown

• Is the maximum loss from a peak to a trough of a portfolio before a new peak is attained. Maximum Drawdown is an indicator of downside risk over a specified time period.

Sharpe ratio

• Is a measure for calculating risk-adjusted return, and this ratio has become the industry standard for such calculations. The Sharpe ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. In other words, it measures how much excess return a portfolio has earned in relation to the level of risk it is exposure to. The higher the ratio the stronger the risk adjusted return.

Calmar ratio

• Is a measure for calculating risk-adjusted return. It is the average return earned per unit of capital loss risk taken in the form of maximum drawdown over a given period.
