Investment mandate and objectives

The portfolio employs a rule based (passive) investment strategy. The GTC Passive Five fund comprises of both local and international asset classes, with a maximum exposure of 75% to equities. The fund is Regulation 28 compliant and aims to outperform inflation plus 5% over rolling 7 year periods. International exposure is kept within regulatory limitation which offers diversification and a local currency hedge.

Features:

- Regulation 28 compliant
- Flexible Asset Allocation
- Local and International exposure
- Capital Growth

Market summary

- Local equities ended the month up +4.2% driven by index heavyweight Naspers (+8.3%), pulling the Industrials sector up to a +5.0% close. The Financials sector posed +4.8% for the month with the Resources sector climbing +2.4%, as AngloGold Ashanti (+13.0%) and Harmony Gold (+10.5%) continued to benefit from an elevated Gold Price. Local property rebounded to close the month up +7.6% after recording a negative return in the previous month.
- Local cash ended the month up +0.6% slightly behind local bonds, which returned +0.8%.
- The South African Reserve Bank (SARB) has cautioned that the scope for further interest rate cuts in emerging markets is highly constrained, as major central banks globally are expected to take a more cautious stance on monetary policy in response to elevated inflation risks.
- After much contention and political in-fighting within the Government of National Unity, the proposed 0.5% VAT increase scheduled for 1 May has been scrapped.
- The MSCI Emerging Markets Equity Index grew +1.3% USD for the month outperforming its developed equity market counterpart. The month started with heightened uncertainty following the US administration's 'Liberation Day' tariff announcements, which sparked a wave of market volatility. However, sentiment improved as the more severe measures were gradually scaled back in the weeks that followed.
- The MSCI World Index returned +0.9% USD for the month. Federal Reserve policymakers have indicated that short-term interest rates will be held steady as they await clearer evidence that inflation is approaching the central bank's 2% target or signs of weakening in the labour market.
- Amid elevated geo-political tension and a subdued global trade environment, GTC remains cautious in our portfolio positioning as we navigate through this market cycle.

Glossary

Standard deviation

- Is a measure that is used to quantify the amount of variation or dispersion of a set of data values around the mean value. This measure is commonly known as volatility and referenced as an explicit measure of risk.

Maximum drawdown

- Is the maximum loss from a peak to a trough of a portfolio before a new peak is attained. Maximum Drawdown is an indicator of downside risk over a specified time period.

Sharpe ratio

- Is a measure for calculating risk-adjusted return, and this ratio has become the industry standard for such calculations. The Sharpe ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. In other words, it measures how much excess return a portfolio has earned in relation to the level of risk it is exposure to. The higher the ratio the stronger the risk adjusted return.

Calmar ratio

- Is a measure for calculating risk-adjusted return. It is the average return earned per unit of capital loss risk taken in the form of maximum drawdown over a given period.
