Quarterly commentary

- South Africa's economy expanded 0.6% in the fourth quarter of last year, supported by a rebound in agricultural output. In March, the South African Reserve Bank kept the repo rate unchanged at 7.50%.
- The MSCI Emerging Market equity index gained +2.9% USD, outperforming its developed market counterpart. Optimism around China's AI capability and improved manufacturing data, along with additional government stimulus boosted market sentiment. India's equity market declined amid profit taking and some economic growth concerns, which prompted their first repo rate cut since May 2020.
- The MSCI World equity Index declined -1.8% USD for the quarter as US mega cap technology stocks turned negative. Global risk appetite further declined towards the end of the quarter as US president Donald Trump's "Liberation Day" looms.
- In their March meeting, both the US Federal Reserve and Bank of England kept interest rates unchanged at 4.5%, maintaining a wait-and-see approach amid persistent inflation and global economic uncertainty. Meanwhile, the European Central Bank (ECB) cut its three key interest rates by 25 basis points, bringing the deposit facility rate to 2.50%. The ECB President Christine Lagarde noted that the highly uncertain macro environment complicates monetary policy decisions, diverging from her past stance suggesting that the path to lower rates is clear.
- Overall, global investor sentiment was largely subdued over the quarter. While the short-term outlook is weak amid extreme volatile, the longer-term picture remains positive. Nonetheless, GTC remains cautious in our portfolio positioning as we navigate through this market cycle.

Glossary

Standard deviation

Is a measure that is used to quantify the amount of variation or dispersion of a set of data values around the mean value. This measure is commonly known as volatility and referenced as an explicit measure of risk.

Maximum drawdown

Is the maximum loss from a peak to a trough of a portfolio before a new peak is attained. Maximum Drawdown is an indicator of downside risk over a specified time period.

Sharpe ratio

Is a measure for calculating risk-adjusted return, and this ratio has become the industry standard for such calculations. The Sharpe ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. In other words, it measures how much excess return a portfolio has earned in relation to the level of risk it is exposure to. The higher the ratio the stronger the risk adjusted return.

Calmar ratio

Is a measure for calculating risk-adjusted return. It is the average return earned per unit of capital loss risk taken in the form of maximum drawdown over a given period.
