## Quarterly commentary

- South Africa's economy stagnated in the first quarter of 2025, recording a +0.1% GDP growth, as strong gains in agriculture were offset by contractions in mining, manufacturing, and utilities. In May, the South African Reserve Bank (SARB) reduced its key interest rate by 0.25% to 7.25%, in line with expectations.
- The MSCI Emerging Markets equity index ended the quarter up +12.0% outperforming its developed market counterpart. The MSCI World Equity Index returned +11.5% for the quarter. The US equity markets closed June and the second quarter at record highs, overcoming April's bear market drop.
- The US Federal Reserve kept interest rates unchanged over the quarter, at 4.25%–4.50%. The Bank of England (BoE) cut interest rates by 25 basis points to 4.25% in May, despite inflation remaining above target at 3.4%. Meanwhile, the European Central Bank (ECB) implemented two rate cuts during the quarter, each of 25 basis points.
- Overall, global investor sentiment was mixed over the quarter. While the short-term outlook is still unclear, the longer-term picture remains positive. Nonetheless, GTC remains cautious in our portfolio positioning as we navigate through this market cycle.

## Glossary

### Standard deviation

Is a measure that is used to quantify the amount of variation or dispersion of a set of data values around the mean value. This measure is commonly known as volatility and referenced as an explicit measure of risk.

### Maximum drawdown

Is the maximum loss from a peak to a trough of a portfolio before a new peak is attained. Maximum Drawdown is an indicator of downside risk over a specified time period.

### Sharpe ratio

Is a measure for calculating risk-adjusted return, and this ratio has become the industry standard for such calculations. The Sharpe ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. In other words, it measures how much excess return a portfolio has earned in relation to the level of risk it is exposure to. The higher the ratio the stronger the risk adjusted return.

### Calmar ratio

Is a measure for calculating risk-adjusted return. It is the average return earned per unit of capital loss risk taken in the form of maximum drawdown over a given period.
