Market summary

- The South Africa's National Budget was approved with key revisions including the country's economic outlook, revised growth projections, rising debt
 servicing costs, the withdrawal of proposed VAT increases, and the continuation of the social relief grant. To offset the removal of the VAT hike,
 inflation adjusted fuel taxes was passed through. The South African Reserve Bank (SARB) cut interest rate by 0.25% to 7.25%, in line with
 expectations. The SARB stated that the cut aims to support a slowing economy.
- Local equities ended the month up +3.0%, supported by contributions across all major sectors. The Resources sector returned +2.3%, driven by notable gains from Sibanye Stillwater Ltd (+27.5%). Financials delivered +2.1%, while Industrials added +3.9%, boosted by Tiger Brands' +19.4% rally. Local property continued its positive trend, posting a return of +2.3% for the month.
- Local cash ended the month +0.6% underperforming local bonds (+2.7%). This marked a second month of recovery for local bonds following four months of underperformance, as concerns around the Budget and the Government of National Unity (GNU) appeared to ease.
- The MSCI Emerging Markets Index recorded +4.3% USD for the month lagging its developed market counterpart. The temporary tariff agreement reached between the US and China during the month raised hopes of a de-escalation in trade tensions, which helped lift equity markets. This also eased concerns about a potential US recession. The positive sentiment was especially beneficial for the Taiwanese and Korean index markets, which were supported by the renewed investor optimism surrounding artificial intelligence.
- The MSCI World Index had a return of +5.9% USD for the month. The US Federal Reserve maintained its key interest rate within the range of 4.25% 4.5%. Fed Chair Jerome Powell acknowledged rising risks of both higher unemployment and inflation but emphasised that the current policy rate provides the flexibility to respond appropriately if needed. The Bank of England lowered its key interest rate by 0.25% to 4.25% in May, in line with market expectations.

Glossary

Standard deviation

• Is a measure that is used to quantify the amount of variation or dispersion of a set of data values around the mean value. This measure is commonly known as volatility and referenced as an explicit measure of risk.

Maximum drawdown

• Is the maximum loss from a peak to a trough of a portfolio before a new peak is attained. Maximum Drawdown is an indicator of downside risk over a specified time period.

Sharpe ratio

• Is a measure for calculating risk-adjusted return, and this ratio has become the industry standard for such calculations. The Sharpe ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. In other words, it measures how much excess return a portfolio has earned in relation to the level of risk it is exposure to. The higher the ratio the stronger the risk adjusted return.

Calmar ratio

• Is a measure for calculating risk-adjusted return. It is the average return earned per unit of capital loss risk taken in the form of maximum drawdown over a given period.
