# Market summary

- South African Monetary Policy Eases: The South African Reserve Bank (SARB) cut the benchmark repo rate by 25 basis points to 7% in July, a move aimed at supporting economic growth. Governor Lesetja Kganyago also announced a new 3% inflation anchor for future forecasts.
- Local Equities Show Strength: South African equities concluded July with a positive return of +2.2%. This performance was largely driven by a +5.2% gain in the Resources sector. Financials and Industrials also contributed positively, returning +1.4% and +1.2% respectively. The local property sector continued its upward trend, posting a +4.8% return.
- Local Fixed Income Performance: Local bonds outperformed cash in July, returning +2.7%, while local cash investments delivered a +0.6% return. This suggests a slightly more favourable environment for longer duration bond investments over the month.
- Emerging Markets Outperformance: The MSCI Emerging Markets Index recorded +2.0% USD for the month, ahead of its developed market counterpart. This was supported by positive developments in China, where improving sentiment and recovering liquidity boosted the economy. In Taiwan, sustained investor interest in artificial intelligence and continued foreign inflows provided significant support to the equity market. Overall, emerging markets showed resilience despite global trade tensions and policy uncertainties.
- Developed Markets Advance Despite Trade Uncertainty: The MSCI World Index posted +1.3% USD in July. The US House of Representatives' approved President Trump's "Big Beautiful Bill" tax and spending package. Central banks in major developed economies largely maintained their stances, with the US Federal Reserve keeping interest rates on hold at 4.25–4.50% and the European Central Bank (ECB) holding its rate at 2%.

# **Glossary**

#### Standard deviation

• Is a measure that is used to quantify the amount of variation or dispersion of a set of data values around the mean value. This measure is commonly known as volatility and referenced as an explicit measure of risk.

# Maximum drawdown

• Is the maximum loss from a peak to a trough of a portfolio before a new peak is attained. Maximum Drawdown is an indicator of downside risk over a specified time period.

# **Sharpe ratio**

• Is a measure for calculating risk-adjusted return, and this ratio has become the industry standard for such calculations. The Sharpe ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. In other words, it measures how much excess return a portfolio has earned in relation to the level of risk it is exposure to. The higher the ratio the stronger the risk adjusted return.

# Calmar ratio

• Is a measure for calculating risk-adjusted return. It is the average return earned per unit of capital loss risk taken in the form of maximum drawdown over a given period.
