As of 30/11/2025

Market summary

- The South African Reserve Bank (SARB) cut the repo rate by 25 basis points to 6.75%. The SARB's local inflation outlook has improved, encouraging a less restrictive monetary policy stance. The Medium-Term Budget Policy Statement focused on fiscal consolidation, introducing a new 3% inflation target and revised GDP growth to 1.2%. It highlighted stronger tax revenue that improved the deficit outlook and stabilised debt-to-GDP around 77.9%.
- Local equities ended the month up +2.3%. The Resources sector gained 10.5% due to strong performances from Anglogold Ashanti (+15.2%), Harmony Gold (+14.7%) and Impala Platinum (+15.0%). Industrials declined -4.8%, while Financials added +2.2% and Listed Property +7.7%.
- Local cash ended the month with a return of +0.6% below local bonds, which returned +3.5%.
- The MSCI Emerging Markets Equity Index shed -2.4% USD for the month lagging its developed market counterpart. Technology heavy markets such as Korea and Taiwan, which had rallied over the course of the year, detracted in November contributing to underperformance in the emerging market.
- The MSCI World Equity Index earned +0.3% USD for the month. Global Markets benefitted from optimism on moderating inflation data and increased expectations of US Federal Reserve (Fed) interest rate cut. UK equities performed positively due to lower gilt yields and a softer Pound. Softer inflation and improving labour-market data also increased expectations that the Bank of England (BOE) would cut rates.

Glossary

Standard deviation

- Is a measure that is used to quantify the amount of variation or dispersion of a set of data values around the mean value. This measure is commonly known as volatility and referenced as an explicit measure of risk.

Max drawdown

- Is the maximum loss from a peak to a trough of a portfolio before a new peak is attained. Maximum Drawdown is an indicator of downside risk over a specified time period.

Sharpe ratio

- Is a measure for calculating risk-adjusted return, and this ratio has become the industry standard for such calculations. The Sharpe ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. In other words, it measures how much excess return a portfolio has earned in relation to the level of risk it is exposure to. The higher the ratio the stronger the risk adjusted return.

Calmar ratio

- Is a measure for calculating risk-adjusted return. It is the average return earned per unit of capital loss risk taken in the form of maximum drawdown over a given period.
