Market summary

- Local equity markets ended the month with up +4.6%. The Financials sector led with +7.3%. This was supported by notable gains from Firststrand Ltd (+11.4%) and Standard Bank Ltd (+10.2%). The Resources sector added 5.6%, the Industrials sector +1.9% and the Local Property sectors +0.1% for the month.
- Local cash delivered a return of +0.6% for the month, lagging local bonds at +2.7%.
- The MSCI Emerging Markets Index returned +3.0% USD for the month ahead of the developed market counterpart. China's central bank kept its key lending rates unchanged for seventh consecutive month in December as anticipated by the investors.
- The MSCI World Index gained a return of +0.8% USD for the month. The US annual inflation rate in December dropped to +2.7%, which was below expectations and marking the lowest level since July of the same year. The US Federal Reserve lowered interest rates by 25 basis points within a range of 3.5% to 3.75% in line with market consensus. The European Central Bank (ECB) kept their rates unchanged for the fourth consecutive time.
- The US Dollar weakened -3.0% relative to the South African Rand over the month to R16.56.
- As market volatility and economic uncertainty remain elevated, GTC remains cautious in our portfolio positioning as we navigate through this market cycle.

Glossary

Standard deviation

- Is a measure that is used to quantify the amount of variation or dispersion of a set of data values around the mean value. This measure is commonly known as volatility and referenced as an explicit measure of risk.

Maximum drawdown

- Is the maximum loss from a peak to a trough of a portfolio before a new peak is attained. Maximum Drawdown is an indicator of downside risk over a specified time period.

Sharpe ratio

- Is a measure for calculating risk-adjusted return, and this ratio has become the industry standard for such calculations. The Sharpe ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. In other words, it measures how much excess return a portfolio has earned in relation to the level of risk it is exposure to. The higher the ratio the stronger the risk adjusted return.

Calmar ratio

- Is a measure for calculating risk-adjusted return. It is the average return earned per unit of capital loss risk taken in the form of maximum drawdown over a given period.
