Investment mandate and objectives

The portfolio employs a rule based (passive) investment strategy. The objective of this portfolio is to outperform a full risk composite benchmark over a rolling 10-year period. This portfolio has been designed for maximum capital growth through a combination of local and offshore asset exposure. The portfolio's offshore exposure provides diversification, higher return potential and protects against local currency depreciation.

Features:

Regulation 28 compliant
Full equity exposure
Local and international exposure
Capital growth

Market summary

- Geopolitical tensions in the Middle East continued to influence global markets in June 2026. Although the US and Iran agreed to a ceasefire, uncertainty remains around the reopening of the Strait of Hormuz, and tensions between the two countries have not been fully resolved.
- In South Africa, first-quarter GDP grew by +0.5% from the previous quarter, pointing to some resilience in the local economy. However, local inflation remains above the 3% target at +4.5% for May 2026.
- Local equities declined -3.7% in June 2026, largely due to weakness in the Resources sector, which fell by -16.4%. Lower precious metal prices weighed on mining companies, with the price of Gold retreating -11.8% over the month. By contrast, the Industrials, Financials and Listed Property sectors gained +2.2%, +2.6% and +3.7% respectively.
- Local cash earned +0.6% in June, while local bonds gained +1.5%. Attractive real yields continued to support demand for South African bonds.
- The MSCI World Index fell by -0.7% USD and the MSCI Emerging Markets Index by -1.4% USD over the month. The declines are primarily attributed to profit-taking in technology shares after an extended period of gains, coupled with a more hawkish stance for the US Federal Reserve amid elevated inflation concerns. This view also contributed to the +1.2% strength of the US dollar against the South African Rand over June 2026.

Glossary

Standard deviation

- Is a measure that is used to quantify the amount of variation or dispersion of a set of data values around the mean value. This measure is commonly known as volatility and referenced as an explicit measure of risk.

Maximum drawdown

- Is the maximum loss from a peak to a trough of a portfolio before a new peak is attained. Maximum Drawdown is an indicator of downside risk over a specified time period.

Sharpe ratio

- Is a measure for calculating risk-adjusted return, and this ratio has become the industry standard for such calculations. The Sharpe ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. In other words, it measures how much excess return a portfolio has earned in relation to the level of risk it is exposure to. The higher the ratio the stronger the risk adjusted return.

Calmar ratio

- Is a measure for calculating risk-adjusted return. It is the average return earned per unit of capital loss risk taken in the form of maximum drawdown over a given period.
